# EATON

Powering Business Worldwide

There's a certain energy at Eaton. It's the power of integrating the competencies of some of the world's most respected names to build a brand you can trust to meet every power management need. The energy created supports our commitment to powering business worldwide.

As the world's demand for high-efficiency hydraulic systems for mobile and stationary applications increase, Eaton is helping to solve these challenges more reliably, efficiently, and sustainably. Our goal is simple; to provide unique solutions across a wide range of markets that keep businesses on the leading edge of change. Visit [Eaton.com/hydraulics/fusion](http://Eaton.com/hydraulics/fusion).

**That's the power of One Eaton.**

# Serving eight key segments - sharing one focus

## Alternative Energy

Making energy sources technically practical and economically sound requires the kind of control made possible by high-quality components. When Eaton is on the inside, you will experience the reliable, consistent performance to create and capture energy—making renewable energy an every-day energy.

## Discrete Manufacturing

Produce at peak efficiency with the superior precision and repeatability of Eaton products. Eaton hydraulic components provide the precise control and consistent operation required for virtually every step in your manufacturing operation. With Eaton, we'll help you redefine the meaning of raw productivity.

## Oil & Gas

As the oil & gas industry continues to face further globalization and consolidation, large-scale organizations that can meet your needs in every corner of the world are more difficult to find. At Eaton, our portfolio of products is only surpassed by our tremendous reach.

## Processing

Whatever your industry, no matter which processes you manage, Eaton parts and systems help keep you up and running. Our components make equipment more efficient and easier to use, so you get optimal machine performance and maximum productivity.

## Agriculture & Forestry

There's a reason farming and forestry are called "working the land." These segments involve some of the hardest work and longest hours of any sector in the economy. Your productivity and profitability depend on the way you manage time and tasks.

## Commercial Vehicles

Eaton technologies can make your driving operation more successful. Greater comfort and productivity help increase driver retention, while reduced emissions, leaks, and noise improve environmental performance. Increased efficiencies overall mean lower costs and higher net revenue.

## Material Handling

Eaton hydraulic systems provide the precise control and consistent operation required for material handling and utility work. With a broad selection of products and solutions built in, Eaton helps make you a master of your domain.

## Construction & Mining

When you work on a large scale, even the details are big. You need to trust every part of the equipment that lets you handle construction and mining jobs. For reliable components that deliver consistent performance in extreme conditions, turn to Eaton.

## Eaton is a leading diversified power management company

Eaton provides reliable, efficient and safe power management for a growing number of industries.

### Understanding and helping our customers succeed

- Listening and understanding to requirements and business drivers
- Delivering solutions with value propositions to solve the critical business needs

### Knowing what's important to our customers and integrating that knowledge into the fabric of our business

- ...to deliver innovative, quality products
- ...to respond fast
- ...to provide dedicated customer service and support around the globe

### Our strength is global reach with local responsiveness and support

- Customers served in more than 150 countries
- Diverse channels ensure reliable availability and support
- Design and engineering teams provide support for standard products and custom solutions
- Eaton experts offer efficient product and application training

# Access Methods

## Remote Access

The FLOCS Remote Access Conversion Kit replaces the old drain plug with a 90 degree pan adapter, hose assembly and quick-disconnect coupling.

### Installation:

1. Remove old drain plug.
2. Replace with the proper size FF1187 pan adapter.
3. Install mounting bracket (and optional 90° adapter).
4. Attach hose assembly to FF1187 pan adapter and mounting bracket.
5. Attach coupling and dust cap.

Your installation is now complete.

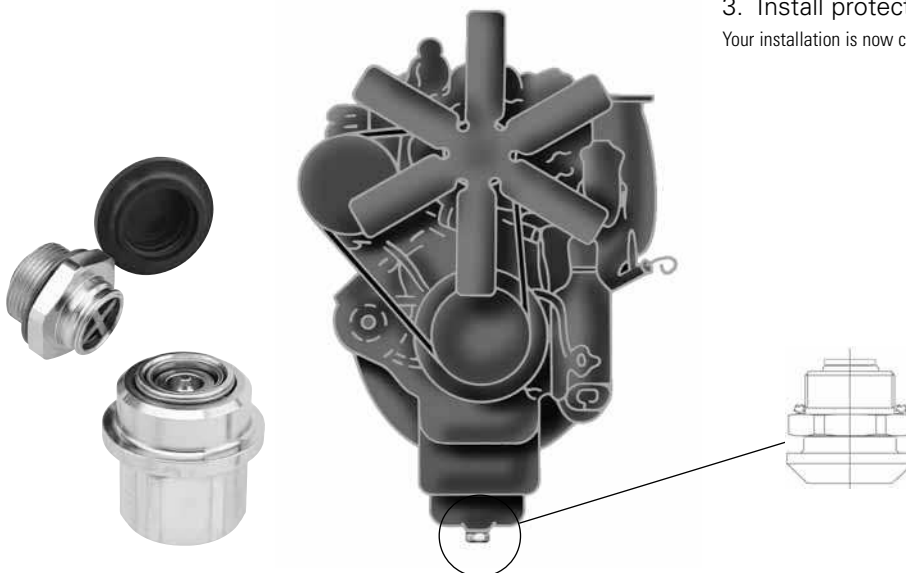

### Evacuation:

When it is time to change the oil:

1. Remove the dust cap.
2. Connect the evacuation hose to the quick-disconnect coupling.
3. Activate the pump, and the used oil is quickly evacuated to storage tanks.
4. Disconnect the evacuation hose and replace the dust cap.

## Direct Access

The FLOCS Direct Access Conversion Kit uses the Eaton-developed FD14 Drain Coupling as an alternative to the standard remote hose kit. This coupling design permits easy, one-hand connection and disconnection of the evacuation unit's hose.

### Installation:

1. Remove old drain plug.
2. Replace with the proper size FD14 Drain Coupling.
3. Install protective cap.

Your installation is now complete.

### Evacuation:

When it is time to change the oil:

1. Remove the protective cap.
2. Connect the evacuation hose to the FD14 Drain Coupling.
3. Activate the pump, and the used oil is quickly evacuated to storage tanks.
4. Disconnect the evacuation hose and replace the protective cap.

# FD14 Drain Couplings

## Male Half Ass'y

Flow Rate (175° F/10W30 oil)

## The Newest, most direct approach to saving time and money.

Providing direct access for fast oil changes.

The FLOCS Direct Access Conversion Kit uses Full-Flow FD14 Drain Coupling as an alternative to the standard remote hose kit. This coupling design permits easy, one-hand connection and disconnection of the drain hose or the evacuation unit's hose.

- Saves time and labor costs
- Minimizes messy spills
- Able to change oil when it's hot
- One-hand connect/disconnect
- Full-flow male half coupling can be used with gravity drain or pump system
- Eliminates damaged or cross-threaded plugs

## FLOCS 30A Air-powered Unit

- |  |                             |
|--|-----------------------------|
| 1. Piston pump                           | 6. Coupling half**          |
| 2. 5 cfm air-operated motor (80-150 psi) | 7. Suction strainer         |
| 3. Override button                       | 8. 1/4" air-supply coupling |
| 4. Cycle gauge                           | 9. 1/4" air-supply nipple   |
| 5. 15' of 1" I.D. suction hose*          | 10. 1" NPT discharge port   |

### (Part No. FF9330A-01) Remote Access (Part No. FF9330A-19) Direct Access

The FLOCS 30A Oil-evacuation Unit is a versatile, air-powered unit designed to be used where an air-power source is available, and electrical units may present a fire hazard. The unit can be adapted for use either on a lube truck or in a maintenance bay.

A FLOCS 30A unit can be used with equal effectiveness on vehicles with small oil-pan capacities (taxicabs, delivery trucks, school buses, etc.), medium capacities (highway equipment, tree-harvesting equipment, etc.) or large capacities (mining or construction equipment, etc.). Speed, ease of operation and versatility make the FLOCS 30A the best rapid oil-evacuation unit for many applications.

\* FLOCS 30A Oil-evacuation Unit with 25' hose assembly is ordered by part number FF9330A-100 (Remote Access), FF9330A-20 (Direct Access).

\*\* Differs with access method.

## FLOCS 15 Electric-powered Unit

- |  |  |
|--|--|

| 2. Gear pump                               | 7. Suction strainer                                    |
| 3. Cycle-run starter button                | 8. 115V AC flow-control switch                         |
| 4. Cycle-run signal light                  | 9. Backflow check valve with a 3/4" NPT discharge port |
| 5. 15' of 1" I.D. suction hose*            |  |

### (Part No. FF9315-01) Remote Access (Part No. FF9315-28) Direct Access

The FLOCS 15 Oil-evacuation Unit is electric powered and is designed for use in fleet maintenance service bays. Used in conjunction with overhead oil-dispensing reels, the FLOCS 15 speeds oil changes in large fleets. In some multilane maintenance shops, the FLOCS 15 concept has been used to implement a "fast-lane" operation, with one lane set aside for high-frequency, routine maintenance functions, leaving the other lanes free for more complex and time-consuming operations.

The FLOCS 15 is compatible with existing oil service equipment and can be installed quickly, without interrupting normal maintenance operations. It discharges old oil into existing storage tanks and shuts off automatically when the old oil has been evacuated. A signal light goes off when the evacuation is complete.

\* FLOCS 15 Oil-evacuation Unit with 30' hose assembly is ordered by part number FF9516-01 (Remote Access), FF9516-02 (Direct Access).

\*\* Differs with access method.

# Remote Access (Aeroquip®) Conversion Kits

## Standard Vehicles

All kits are designed to accommodate manual drain when necessary.

**These components are common to each kit regardless of the part number.**

Item #	Part #	Description
Item # 2	4412-8-10S	Hose Fitting (Reusable)
Item # 2	FJ3152-0810S	Hose Fitting (Crimp)

# Oil Thief System

## Providing easy access to oil samples for spectrographic analysis.

With the spectrographic analysis of engine oil being increasingly required, the problem of obtaining oil samples quickly, economically and efficiently has demanded more attention.

With the push of a button, an oil sample can be taken during the evacuation cycle of any FLOCS unit and collected in a standard sampling bottle for analysis. It takes less than 15 seconds to collect an oil sample with the Oil Thief.

Because oil-analysis facilities provide differing oil sample bottles, the FLOCS Oil Thief is available with a sample bottle port thread to match your needs. (Refer to the sample bottle thread sizes and corresponding Oil Thief part numbers listed in this chart.)

### Features:

- Push-button operation
- Light weight
- Repairable seals
- Accepts a wide variety of sample bottle threads

### Physical Characteristics:

Buna-N Seals for -40 to +225 Degrees Fahrenheit Service. Vacuum Capable to 28" Hg.

In a typical FLOCS system, a Male NPTF-to-Male NPTF adapter (2083-12-12s) is used on one end of the Oil Thief to connect to the female quick-disconnect coupling.

### Operating Instructions:

The Oil Thief is compatible with any FLOCS evacuation unit. Simply install an Oil Thief between the evacuation hose line and the coupling half; then attach a sample bottle. Wait a few seconds after starting the evacuation cycle (to flush away any oil from the last evacuation); then depress the sample collection button for approximately ten seconds. Release the button and remove the sample bottle. Clean the Oil Thief sample bottle port, attach another bottle and you are ready for the next sample.

### Note:

When not in use, the Oil Thief should have a spare sample bottle attached to maintain valve cleanliness.

### Benefits:

- No-mess oil sample
- Economical – one Oil Thief per maintenance bay evacuation pump
- Allows oil sampling while oil is still hot, without employee hazard

<b>Oil Thief Part Number</b>	<b>Sample Bottle Thread Size (In Inches)</b>
FF9300-75-0001	1.480-6 (or 38mm)
FF9300-75-0002	2.070-6
FF9300-75-0003*	1.580-6
FF9300-75-0004*	1.750-6 (or 45mm)

\*Available by special order.

# Remote Access Conversion Kit Installation

## 1. Selecting the Conversion Kit

Remove the oil pan drain plug and drain engine oil. Measure the thread on the pan plus with a thread gauge. The thread size will determine the specific conversion kit to be used. Kits are available in two styles: 1) assembly kits (contain mounting hardware and hose assembly), and 2) oil pan drain fitting and coupling with mounting bracket (installer must furnish hose assembly). Hose length in inches ("L") is added to the basic part number when ordering assembled kits.

## 2. Installation

Determine the length of hose required for your vehicle. If the hose length is not known, mount the quick disconnect coupling and bracket (see page 13) and route the hose from the coupling bracket to the oil pan drain. Refer to step 5 for proper routing, mark and cut the hose to length. Following step 3 install the hose fittings to complete the hose assembly. Install the oil pan drain fitting (per step 6) and the hose assembly.

Pan Plug Thread Size	Assembled Kit No.	Hardware Kit No.
1/2-20	F400-L	FF428
18 x 1.5 mm	FF401-L	FF429
14 x 1.25 mm	FF402-L	FF430
10 x 1mm	FF403-L	FF431
1 1/4-18	FF404-L	FF432
1-18	FF405-L	FF433
7/8 - 18	FF406-L	FF434
24 x 2mm	FF410-L	FF438
9/16 - 18	FF952-L	FF453
3/8 - 18 NPT (Pipe)	FF411-L	FF439
1/2 - 14 NPT (Pipe)	FF412-L	FF440
3/4 - 14 NPT (Pipe)	FF413-L	FF441

## 3. Assembling the Hose Line

A. Put the socket in vise and screw hose into socket counterclockwise until it bottoms. Back off 1/4 turn.

B. Oil nipple threads and inside of hose liberally. Use heavy lube oil.

C. Screw nipple clockwise into socket and hose. Keep hose from turning while assembling nipple. Leave 1/32" to 1/16" clearance between nipple hex and socket.

## 4. Mounting the Coupling

**Note:** The coupling bracket should be mounted so that the coupling valve is located above the oil level in the crank case. Make sure that the coupling is mounted firmly and located so that it will not be damaged during normal operation of the vehicle.

A. Attach mounting bracket to desired location on vehicle, preferably near the dipstick. Screw assembled fitting into bracket until enough thread is exposed on opposite side to assemble and tighten the quick disconnect coupling.

B. Assemble dust cap and coupling to mounted hose fitting. Use pipe thread sealant. Check for any leakage after kit is installed.

# Remote Access Conversion Kit Installation Continued

## 5. Routing the Hose

A. Avoid heat. If the hose must be routed past the manifold or exhaust pipe, use Firesleeve for heat protection.

B. Avoid sharp or abrasive edges. Use Eaton protective coil/sleeve if hose might be cut or chafed or use support clamp provided to avoid abrasion.

C. Avoid kinking. Tight bends may kink hose. Observe bend radius limitations.

## 6. Installing the Oil Pan Drain Fitting

A. Lubricate the O-ring seal on the Oil Pan Drain Fitting. Screw the fitting into the oil pan until the last thread on the upper set of threads is engaged.

B. Position the elbow and tighten the jam nut (two wrenches needed). Screw the hose fitting into the elbow and tighten all connections.

C. Oil may be manually drained by disconnecting the hose fitting from the oil pan adapter.

# Air Units

## FLOCS 30A Air-powered Unit

### Operation and Service Info

- |  |                             |
|--|-----------------------------|
| 1. Piston pump                           | 6. Coupling half**          |
| 2. 5 cfm air-operated motor (80-150 psi) | 7. Suction strainer         |
| 3. Override button                       | 8. 1/4" air-supply coupling |
| 4. Cycle gauge                           | 9. 1/4" air-supply nipple   |
| 5. 15' of 1" I.D. suction hose*          | 10. 1" NPT discharge port   |

### Specifications

- Maximum discharge pressure: 1/5 of the input air pressure (power source).
- Recommended operating temperature of fluid: +60° to 180°.
- Strainer screen size: size 35 mesh.
- Flow rate: see flow chart on page 16.
- Pump power source: 80 to 150 psi air at 5 CFM minimum.
- Fluid handling compatibility: all petroleum base fluids below 6000 SSU
- Minimum discharge line: size 1" I.D. (-16).
- Mounting requirements: see Fig. 3, page 14.
- 15' of 1" I.D. suction line standard.
- 5601-12-12 female coupling.

### Installation Instructions

Mount the unit for easy accessibility to the vehicles to be serviced. It may be mounted in either a horizontal or vertical position. A mounting bracket is provided for rigid mounting of the pump (reference Figure 3 for detail dimensions). The pump motor operates on 80-150 psi air at 5 CFM minimum. The unit is to be mounted so that the cycle gauge is in full view of the operator and the override button and strainer cleanout are readily accessible.

1. Connect the used oil discharge line to the 1" pipe port at the top of the unit. The discharge line must be no higher than 10 feet above FLOCS unit. It is important to keep the discharge line large to maintain maximum efficiency. Use a 1" I.D. pipe for lines 15' to 30' long and a 1 1/4" I.D. pipe for lines 30' to 100' long. Make sure the discharge line does not develop more head pressure than 1/5 of the air pressure

### Operation

The FLOCS 30A unit is a simple self-controlled automatic oil evacuator. Once it has been started it will operate until all the oil has been evacuated from the oil pan. The unit will stop automatically when air enters the suction hose.

This unit is controlled by a normally closed, air supply shut-off valve, which requires the pump vacuum to hold it open. At the end of the evacuation cycle air in the suction line destroys the vacuum causing the control valve to shut off the air pressure supply and stop the pump. The unit also incorporates a strainer to prevent

large particles from damaging the pump.

### To operate:

1. Attach the FLOCS 30A unit quick disconnect coupling to the mating conversion kit coupling half on the equipment.
2. Press the red override button to start the unit; hold for approximately 5 seconds. Cycle gauge will indicate run condition.
3. The unit will shut off automatically when all oil is evacuated. The cycle gauge will indicate when the unit is off. Disconnect the evacuation line.

source. (Example: air power source of 150 psi, discharge head pressure of 30 psi maximum.)

2. Connect the air supply line into the 1/4" NPTF port of the quick disconnect coupling supplied with the unit. The air supply line should be equipped with an air line water filter to prevent water from contaminating the pump control and/or causing freezing-up. A lubricator is also recom-

mended for the air supply line (use non-detergent oil in the lubricator).

3. Install the 15' evacuation line by screwing the swivel hose fitting into the female thread on the strainer. Use pipe dope to insure a proper seal. Do not over tighten.

### Note:

The unit should not be mounted in a position requiring more than 10 feet of evacuation lift.

## FLOCS 30A Parts List and Assembly Drawing

### Operation and Service Info

#### Servicing Components

Instructions for Rebuilding Shut-Off valve (P/N FF9330A-03)

Figure 2

#### Servicing the Strainer

1. Remove the four cover screws, #1; remove button, #3; remove and replace diaphragm if necessary, #5. For assembling, torque cover screws 25-30 in.-lbs.
2. Remove plastic cap, #10; spring, #8, and valve, #7. Replace the O-ring seal, #9, on the cap. Check the bonded seal on the valve, #7; inspect for foreign
3. Replace O-ring seal, #2, with a 22559-00B O-ring. Care must be taken not to scar the seal area upon removal of the O-ring.
4. Lubricate all seals with petroleum jelly prior to installation. Make sure all metal parts are clean and not damaged.

5. Assemble in reverse order.

#### Note:

A complete shut-off valve is available as an assembly for replacement.

Order by Part Number **FF9330A-03**.

The strainer should be serviced daily under normal fleet operation conditions. If the strainer becomes clogged or partially blocked with residue, the evacuation operation will slow down due to lack of oil flow to the pump.

1. Remove the strainer clean-out plug and screen.
2. Wash the plug and screen with clean fuel oil.
3. Replace the plug and screen. Tighten wrench-tight.
4. Be careful not to crack the castings or pipe bushings when reassembling the plug. Cracked and/or leaking castings will result in insufficient pumping.

#### Troubleshooting the FLOCS 30A

**Problem:** Unit will not run when override button is pushed.

#### Correction

- A. Check the air supply line to see if it is connected and the air is turned on.

**Problem:** Unit will not continue running after the button is released.

#### Correction

- A. Button was not in override long enough; hold override button until cycle gauge indicates run.

- B. Check for vacuum leakage at strainer suction line, vehicle kit and/or hose fittings on control regulator.
- C. Check air pressure and CFM to make sure that the minimum 80 psi and 5 CFM are available to pump.
- D. Check the strainer for contamination.
- E. Check regulator for damaged seals or diaphragm. Reference Figure 2, page 16 for servicing.
- F. Check oil dipstick; oil pan may be empty.

connections.

**Problem:** Unit shuts off before all oil is evacuated.

#### Correction

- A. Check all threaded connections in suction line for vacuum leakage. Mount vacuum gauge in mating coupling half. Plug into end of suction line. Run pump to get a vacuum. Watch gauge. A sudden loss of vacuum indicates a suction leak.

**Problem:** Unit will not shut off after all the oil has been evacuated.

#### Correction

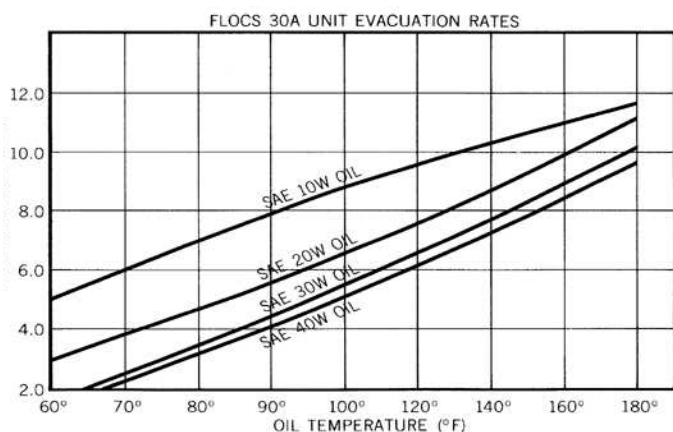

- A. Check for plugged coupling at vehicle kit.

**Problem:** Cycle gauge will not indicate the mode the pump is in.

#### Correction

- A. Check gauge to see if indicator hand is loose.
- B. Check for any leaks in thread and hose fitting

- B. Check regulator for damaged seals or diaphragm. Reference Figure 2, page 16 for servicing.

# Electric Units

## FLOCS 15 Electric-powered Unit

### Operation and Service Info

#### Specifications

- Maximum discharge pressure-50 psi
- Maximum fluid lift-10ft
- Operating temperature (of fluid) +20° to +180°
- Strainer screen size-35 mesh
- Flow rate-see flow chart page 24
- Motor electrical rating- 115V., 60CY., 20 APM AC
- Fluid handling compatibility-all petroleum base fluids below 6000 SSU

#### Installation Instructions

Mount the unit for easy accessibility to vehicles to be serviced. The pump motor operates on 115V AC 20 AMP. To install unit:

1. Remove cover plate from the control panel.
2. Drill an access hole on the side or the bottom of the control box (3/4" hole recommended for conduit). Run service wiring through access hole.
3. Connect a service grounding wire to one of the two bracket bolts on the side of the control box.
4. Connect the live wire to the 6" black lead.
5. Connect the neutral wire to the 6" white lead.
6. Tighten conduit or cord connector in 3/4" access hole.
7. Replace control panel and tighten in place.
8. Connect the old oil discharge line to the 3/4" NPT port on the check valve.
9. Install the 15' evacuation line by screwing the swivel hose fitting into the female NPT thread on the strainer adapter (a 90° adapter is available to suit installation). Caution: Do not over tighten pipe

The FLOCS 15 is a simple, almost totally automatic machine.

#### To operate:

1. Attach the suction line coupling half to the FLOCS coupling half on the vehicle. To connect the coupling, retract the knurled sleeve, push the coupling halves together and release the sleeve.
2. Press the cycle start button to start the unit. The cycle run light will come on.
3. The unit will shut off automatically when all oil is evacuated. The signal light will shut off. Disconnect the evacuation line.

- Minimum discharge line 3/4" I.D.
- Mounting requirements-per NEMA 56 C Frame

threads into strainer. The use of pipe sealant is recommended.

10. The timing relay (in the control box) is factory set for 25 seconds. The purpose of the timing relay is to keep the pump engaged until the initial flow of oil reaches the pump from the vehicle. For instructions on adjustment of the timing relay, see page 20.

#### Note:

The unit should not be mounted more the 10 ft. above floor level to allow no more than 10 ft. of evacuation height. The discharge line should be plumbed so as not to cause more than 50 psi head pressure.

38	2	Wire Connector	FF9310-38	Steel & Plastic

# Servicing Components

## Instructions on adjustments of the flow switch:

Figure 3

1. Remove the black switch cover by loosening the two screws on the side and pull off the cover.

2. If a small amount of oil remains in the crankcase after the pump shuts off, the adjusting screw should be turned counterclockwise to decrease the sensitivity of the switch. DO NOT remove the screw completely or back

it out so far as to cause interference with the replacement of the cover.

3. If the pump stays on when no oil is flowing, the adjusting screw should be turned clockwise until the pump shuts off.

## Instructions on adjustment of the time delay-relay switch:

Figure 4

1. The timing relay is factory pre-set for a normal time delay on most applications (approximately 25 seconds).

2. To increase the time setting, turn the adjusting screw clockwise.

3. To decrease the time setting, turn the adjusting screw counterclockwise. A fraction of a turn will add or subtract 10-15 seconds of time.

## Servicing the Strainer:

Figure 5

The strainer should be serviced daily under normal operating conditions. If the strainer becomes clogged or partially blocked with engine residue, the evacuation operation will slow down due to lack of oil flow to the pump.

1. Remove the strainer clean out plug (Figure 5-1), and pull the screen (Figure 5-2) out.  
2. Wash the plug and screen in clean fuel oil.

3. Place screen in plug counter bore and replace assembly in strainer housing. Tightening plug wrench tight. Use of pipe thread sealant is recommended.

# Troubleshooting

**Problem:** Unit operates approximately 25 seconds, then shuts off before all of the oil is out of the vehicle engine.

**Correction:**

- A. Oil may have too heavy viscosity due to a heavy weight oil or cold oil. The engine of the vehicle should be started and run to heat the oil to above 70° or set the time delay switch to hold the pump engaged longer than the standard 25 seconds factory setting. See time delay switch adjustment (Figure 4), page 20.
- B. Strainer screen may be plugged with foreign material. Clean strainer screen in diesel fuel (Figure 5), page 20.
- C. The FLOCS unit may be trying to lift oil from too low a level. 10 feet lift is maximum. Move the FLOCS unit closer to the vehicle oil pan level.
- D. Hose connections may not be right at the vehicle pan plug. Check and tighten hose to plug union connection.

**Problem:** Unit doesn't go into the evacuation cycle when "cycle run" button is pushed.

**Correction:**

- A. Check wiring to be sure there are no broken or disconnected wires.
- B. Check fuse on the power line to be sure power is being supplied to the unit.

**Problem:** Evacuation is not fully completed when unit shuts off.

**Correction:**

- A. Flow switch may be set too high and be too sensitive to the lower stream of oil near the completion of evacuation. Adjust flow switch (Figure 3), page 20.
- B. Broad flat oil pans with drain connection coming out the side instead of the bottom can cause air to enter into the drain line causing premature shut off. Run a second cycle by resetting the cycle start button.
- C. Cold oil in the oil pan can cause slow drain down of the oil pan and allow the FLOCS unit to shut off prematurely. Start vehicle engine and warm oil above 70° before evacuating.
